

Lin–Kernighan heuristic

This algorithms can be used as a part of TSP solving algorithm. Given a solution it explores its neighbourhood and returns a better one. If you try to read about it on Wikipedia, be careful, as the article contains some mistakes.

1. Solve sub-problems:
 - check if a set of edges is a correct tour
 - find an alternating trail for a given solution
 - modify a given solution using a trail
2. Implement it the entire heuristic.
