

Branch and Bound

The Branch and Bound approach divides the solution space into regions and for each region bounds are evaluated – an upper bound and a lower bound. This method can limit the space being searched which helps to save time.

1. Solve the Assignment problem using Branch and Bound.
2. Solve the Knapsack problem using Branch and Bound approach.
3. Implement a brute-force algorithm solving TSP. Next try to improve it using Branch and Bound. For example if the distance between two cities is bigger than the current best solution – no solution should use this path.
