

Pseudo-polynomial algorithms

1. Write a program solving knapsack problem, using a pseudo-polynomial algorithm. The input is as follows – in the first line there will be two, space-separated numbers, number of items (n) and the capacity of the knapsack (C). Next n lines will describe the item. Each line will contain two space-separated integers: value of the item (v_i) and its size (s_i).
2. Use your solution to solve the decision version of the set partition problem. Try not to modify your algorithm, just add some code at the beginning and at the end.
